

Answer the three questions silently, and then wait for further instructions from your teacher.

1. What is one familiar thing you saw using the Genie?
2. What is one thing you noticed using the Genie that you think might be important to understanding the relationship between alleles and traits?
3. What questions do you have about what you observed using the Genie?

When directed to do so by your teacher, discuss your ideas above with a partner and/or small group. How does your thinking about these questions compare to others' with whom you shared your ideas?
